

Gas Models – Supplemental Worksheet

1. Calculate the pressure exerted by 0.4891 mol of N₂ in a 1.0000 L container at 27.0°C. (Find a van der Waals constants table).

- A. Use the ideal gas law.
- B. Use the van der Waals equation.
- C. Compare the results from a and b.

$$A. PV = nRT \quad P = \frac{0.4891 \text{ mol} \times \frac{0.08206 \text{ L atm}}{\text{K mol}} \times 300\text{K}}{1.0000\text{L}} = 12.04 \text{ atm}$$

$$B. a = 1.390 \text{ atm L}^2/\text{mol}^2 \quad b = 0.0391 \text{ L/mol}$$

$$\left(P + \frac{1.390 \text{ atm L}^2}{\text{mol}^2} \times \left(\frac{0.4891 \text{ mol}}{1.0000\text{L}} \right)^2 \right) \left(1.0000\text{L} - \left(0.4891 \text{ mol} \times \frac{0.0391\text{L}}{\text{mol}} \right) \right) = 12.04 \text{ L atm}$$

$$(P + 0.333\text{atm})(0.9809\text{L}) = 12.04 \text{ L atm} \quad P = 11.94\text{atm}$$

C. *The ideal gas law is higher by 0.1 atm.*

2. From the van der Waals constant *a* for the gases H₂, CO₂, N₂, and CH₄, predict which molecule shows the strongest intermolecular attractions.

$$H_2 = \frac{0.244 \text{ atm L}^2}{\text{mol}^2} \quad N_2 = \frac{1.39 \text{ atm L}^2}{\text{mol}^2} \quad CO_2 = \frac{3.59 \text{ atm L}^2}{\text{mol}^2} \quad CH_4 = \frac{2.25 \text{ atm L}^2}{\text{mol}^2}$$

a is a measure of intermolecular attractions. Therefore higher a is a greater attraction. CO₂ has highest a.

3. Calculate the temperature of a container with 10.76 atm pressure exerted by 1.502 mol of CO₂ in a 3.5000 L.

$$a = 3.59 \text{ atm L}^2/\text{mol}^2 \quad b = 0.0427 \text{ L/mol}$$

$$\left(10.76\text{atm} + \frac{3.59 \text{ atm L}^2}{\text{mol}^2} \times \frac{1.502\text{mol}^2}{3.5\text{L}^2} \right) \left(3.5\text{L} - \left(1.502\text{mol} \times \frac{0.0427\text{L}}{\text{mol}} \right) \right) = 1.502\text{mol} \times \frac{0.08206 \text{ atm L}}{\text{mol K}} \times T$$

$$11.4\text{atm} \times 3.4 \text{ L} = \frac{0.123 \text{ atm L}}{\text{K}} \times T$$

$$T = 318\text{K}$$

4. A sample of 7.50 kg gaseous oxygen fills a 100 L flask at 289°C. What is the pressure of the gas, calculated from the van der Waals equation of state?

$$a = 1.360 \text{ atm L}^2/\text{mol}^2 \quad b = 0.03183 \text{ L/mol}$$

$$\frac{7.5 \times 10^3 \text{ g}}{32 \text{ g/mol}} = 234 \text{ mol}$$

$$\left(P + \frac{1.360 \text{ atm L}^2}{\text{mol}^2} \times 234 \text{ mol}^2 \right) \left(100 \text{ L} - \left(234 \text{ mol} \times \frac{0.03183 \text{ L}}{\text{mol}} \right) \right) = 234 \text{ mol} \times \frac{0.08206 \text{ atm L}}{\text{mol K}} \times 562 \text{ K}$$

$$(P + 7.45 \text{ atm})(92.6 \text{ L}) = 10791 \text{ atm L} \quad P = 109 \text{ atm}$$
